

# THE LOGIC OF NULL HYPOTHESIS STATISTICAL TESTING

# RESEARCH QUESTION

💡 Can a Social Comparison Nudge Reduce Electricity Consumption?

## Your Energy Usage

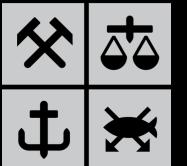

Compared to Similar Neighbors

⚠️ You're using **MORE** than your efficient neighbors

⚠️ And **MORE** than average in your area

NHH  
TECH3

# STEP 1: FORMULATE A HYPOTHESIS

**Hypothesis:** A testable answer to the research question

**In our case:** Social Comparison Nudge Reduces Electricity Consumption

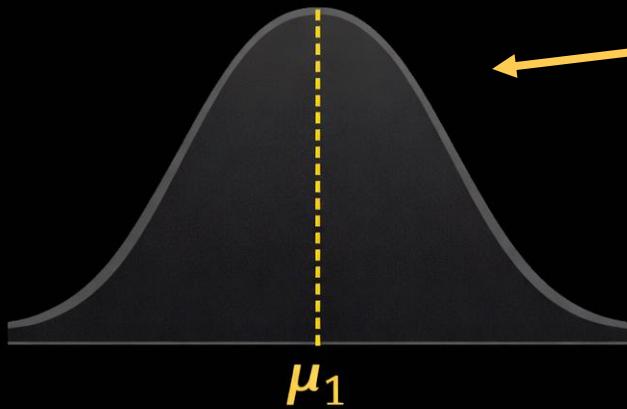

## •**STEP 2: SPECIFY NULL AND ALTERNATIVE HYPOTHESES**

**Statistical hypotheses:** Statements about populations

...often expressed in terms of population parameters (mean  $\mu$ , proportion  $p$ , variance  $\sigma^2$  ...)

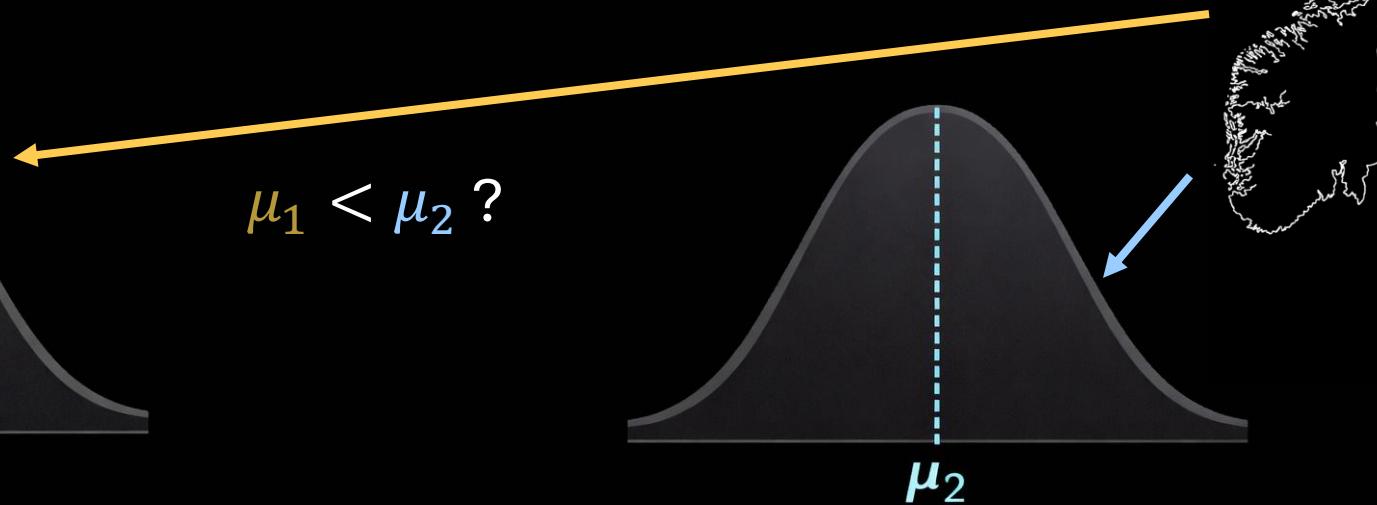

## •STEP 2: SPECIFY NULL AND ALTERNATIVE HYPOTH

Energy nudge example:

Population 1: Households that receive a social comparison nudge

Mean electricity consumption:  $\mu_1$

Population 2: Households that do not receive a nudge

Mean electricity consumption:  $\mu_2$

## •STEP 2: SPECIFY NULL AND ALTERNATIVE HYPOTHESES

**Null-hypothesis ( $H_0$ ):** Describes what the population parameters would look like if your hypothesis is not supported.

**Alternative hypothesis ( $H_A$ ):** Describes how population parameters would look if your original hypothesis is correct.

## •STEP 2: SPECIFY NULL AND ALTERNATIVE HYPOTHESES

No effect of nudging:

$$H_0: \mu_1 = \mu_2$$

An effect of nudging:

$$H_A: \mu_1 \neq \mu_2 \quad (\text{two-sided/non-directional})$$

$$H_A: \mu_1 < \mu_2 \quad (\text{one-sided/directional})$$

## •STEP 2: SPECIFY NULL AND ALTERNATIVE HYPOTHESES

**Hypothesis:** Social Comparison Nudge Reduces Electricity Consumption by more than 200 kWh

## •STEP 2: SPECIFY NULL AND ALTERNATIVE HYPOTHESES

No meaningful effect:

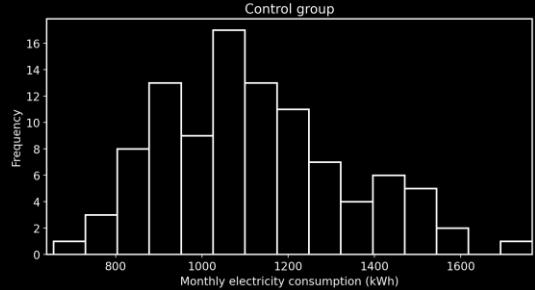

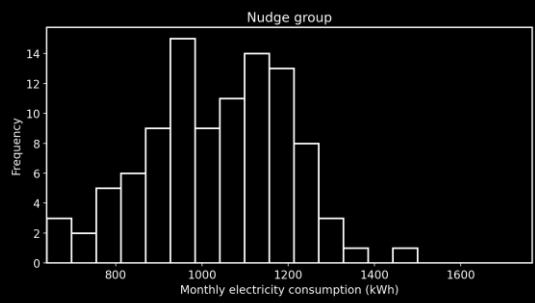

$$H_0: \mu_2 - \mu_1 \leq 200$$

Meaningful effect:

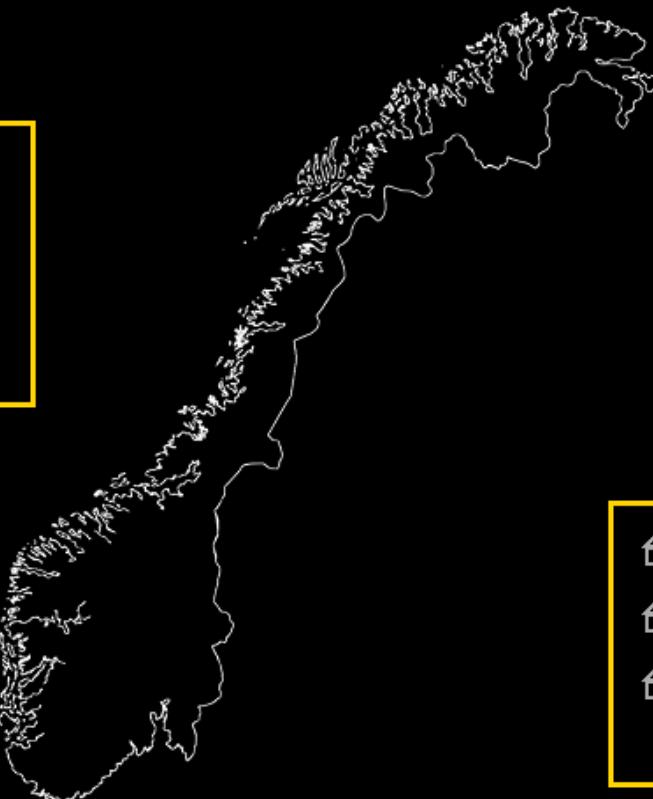

$$H_A: \mu_2 - \mu_1 > 200$$

# STEP 3: COLLECT SOME DATA RELEVANT TO THE HYPOTHESIS

1050 kWh ( $\bar{X}_1$ )

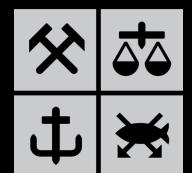

Nudge group  
n = 100

Control group  
n = 100

1125 kWh ( $\bar{X}_2$ )

NHH  
TECH3

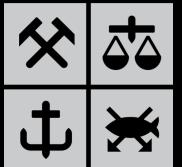

# STEP 4: COMPUTE A TEST STATISTIC

Null Hypothesis ( $H_0$ )

Observed Data

NHH  
TECH3

# STEP 4: COMPUTE A TEST STATISTIC

Null Hypothesis ( $H_0$ )

$$H_0: \mu_1 - \mu_2 = 0$$

•  
|  
|

Observed Data

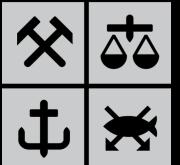

$$\bar{X}_1 - \bar{X}_2 = -75\text{kwh}$$

|  
|

$$T = (\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2) = -75\text{kwh}$$

NHH  
TECH3

# STEP 4: COMPUTE A TEST STATISTIC

Null Hypothesis ( $H_0$ )

$$H_0: \mu_1 - \mu_2 = 0$$

•  
|  
|

Observed Data

$$\bar{X}_1 - \bar{X}_2 = -75\text{kwh}$$

|  
|

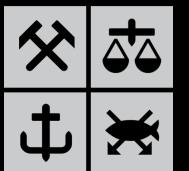

$$T = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}} = -2.45$$

A world where  $H_0$  is true: The  
nudge has no effect

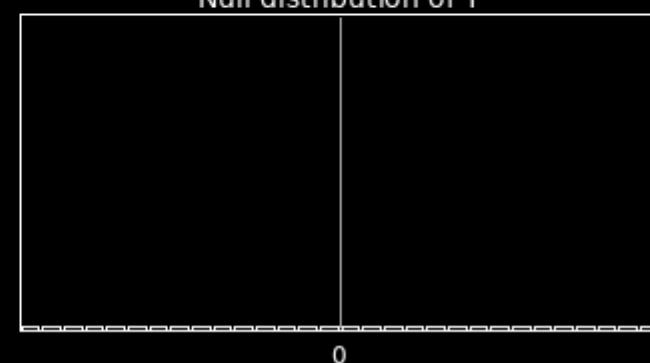

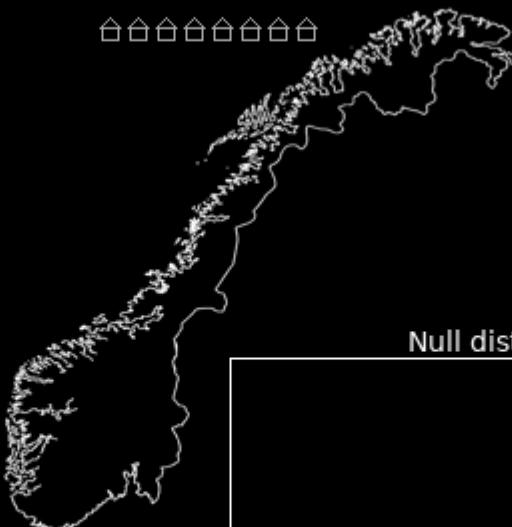

NHH  
TECH3

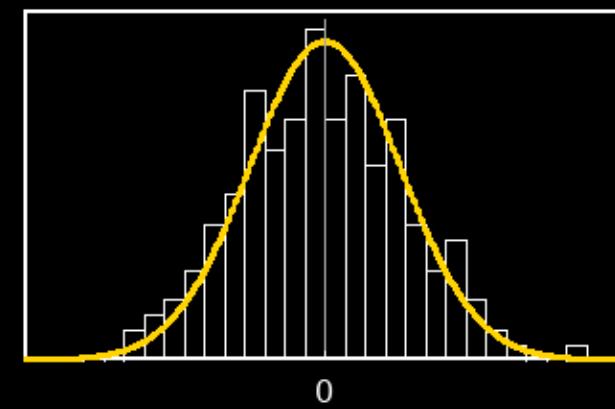

A world where  $H_0$  is true: The nudge has no effect

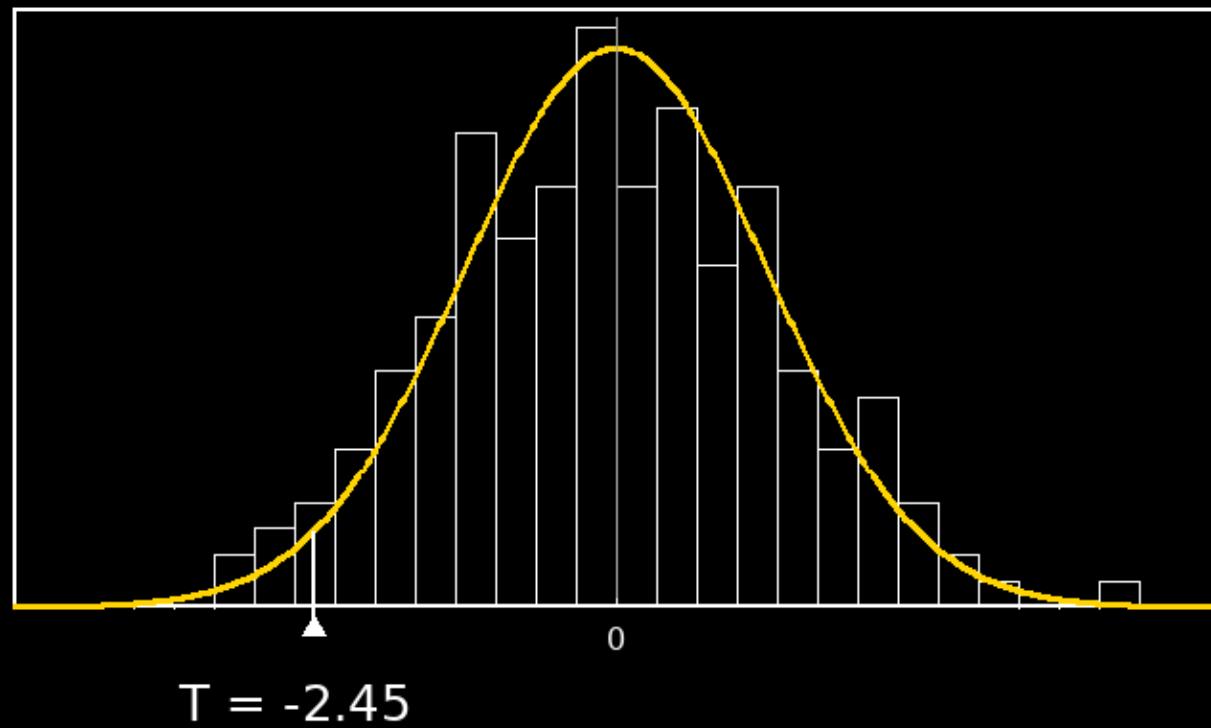

↓  
 $T = -1.60$

Null distribution of  $T$

Null distribution of  $T$

## **STEP 5: DETERMINE THE PROBABILITY OF THE OBSERVED RESULT UNDER THE NULL HYPOTHESIS**

**P-value:** The probability of obtaining a test statistic as extreme as — or more extreme than — what we observed, under the assumption that the null hypothesis is true.

**Null distribution:** The distribution of the test statistic when the null hypothesis is true.

- “Classical” methods
- Resampling and simulation methods

# Classical methods

$$H_0: \mu_1 = \mu_2$$

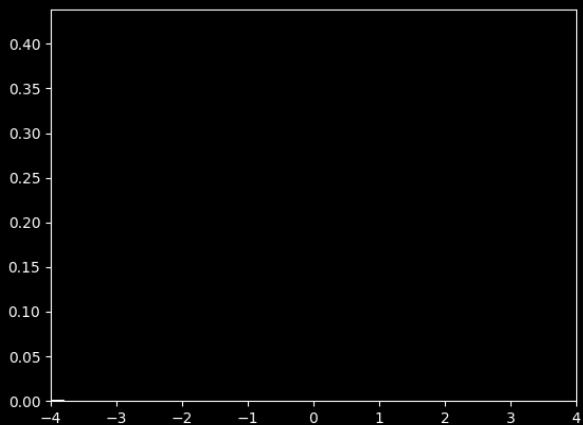

$$T = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

# Classical methods

$$H_0: \mu_1 = \mu_2$$

$$T = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}}}$$

T-distribution

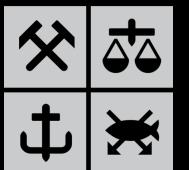

$$H_0: \sigma_1 = \sigma_2$$

$$F = S_1^2 / S_2^2$$

$$H_0: Independence$$

$$\chi^2 = \frac{\sum(o_i - e_i)^2}{e_i}$$

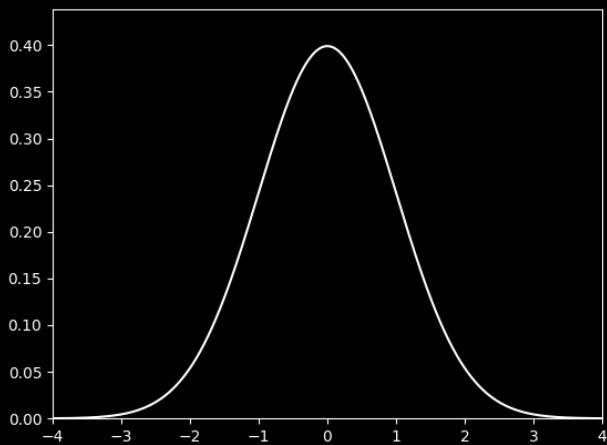

# Classical methods

$$H_0: \mu_1 = \mu_2$$

$$T = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

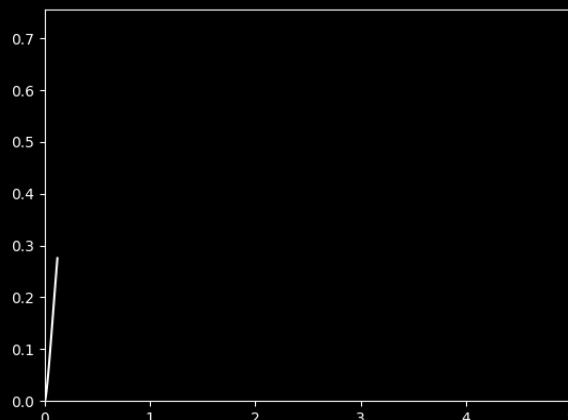

T-distribution

$$H_0: \sigma_1 = \sigma_2$$

$$F = S_1^2 / S_2^2$$

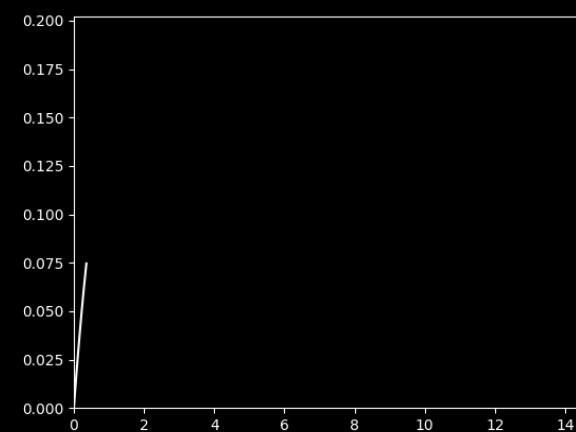

F-Distribution

$$H_0: Independence$$

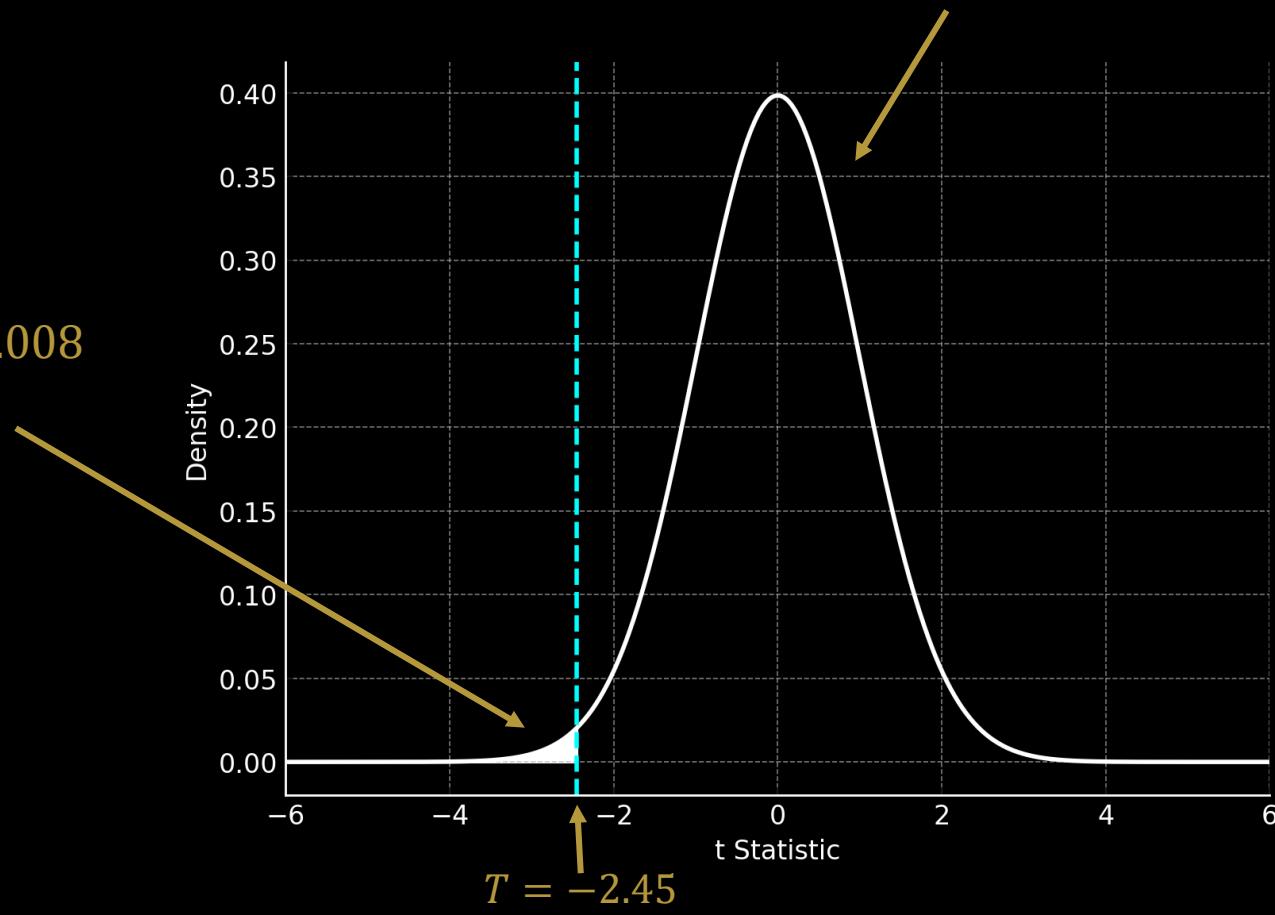

$$\chi^2 = \frac{\sum(o_i - e_i)^2}{e_i}$$

Chi-squared distribution

*t – distribution with 195 degrees of freedom*

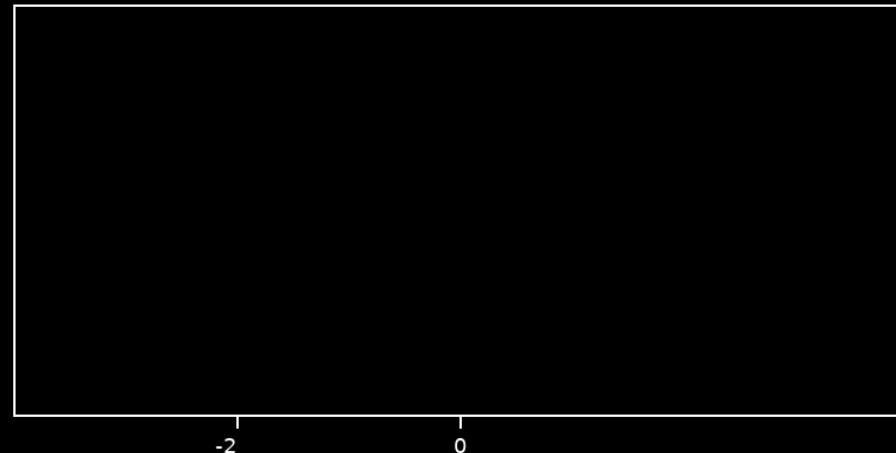

$$P\text{-}value = P(T \leq -2.45 | H_0) \approx 0.008$$

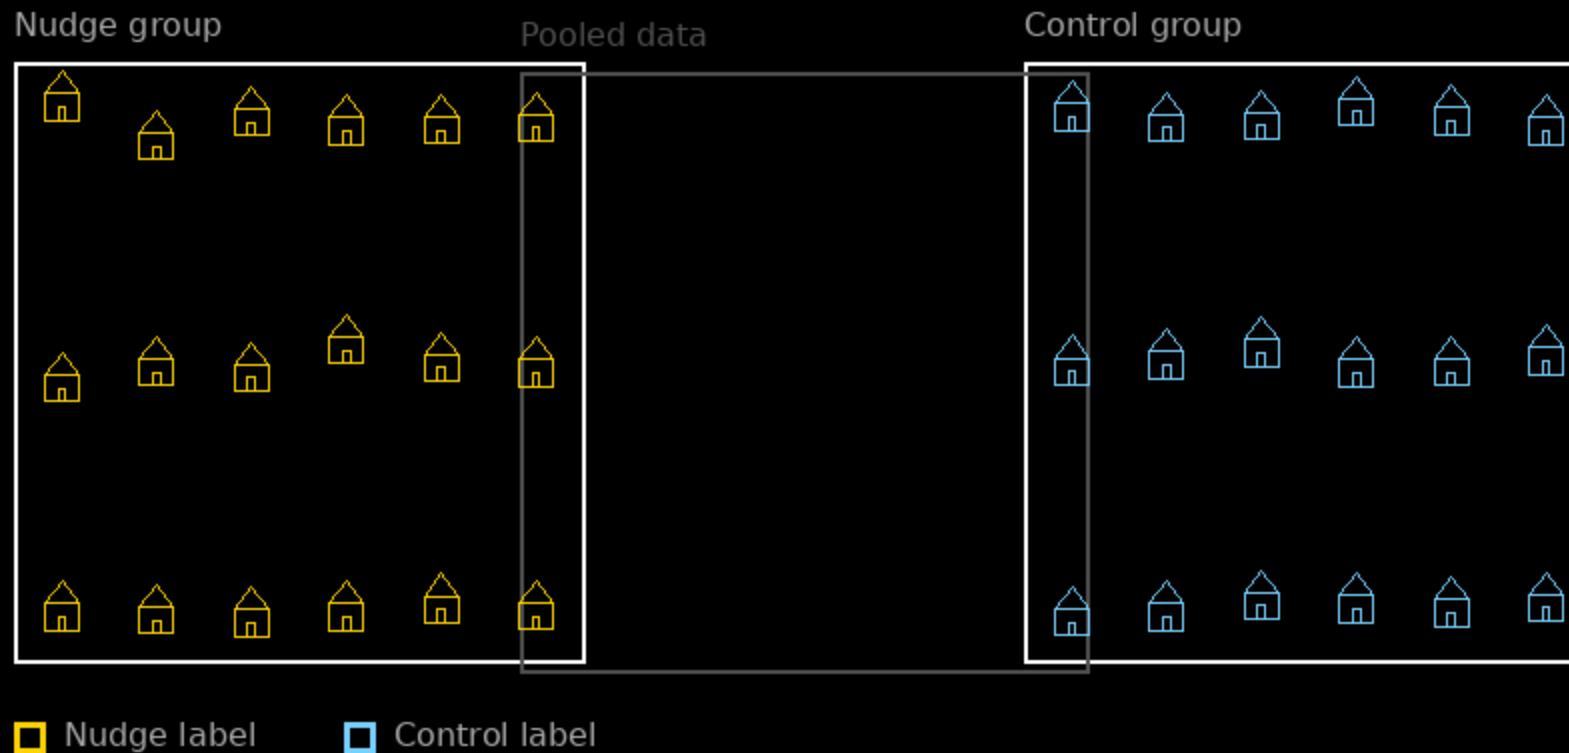

## Resampling/simulation method:

- We **simulate/resample data** from a world where the null hypothesis is true many times.
- Each new dataset produces **a new test statistic**.
- The **proportion** of test statistics **more extreme** than our observed value gives us a **p-value**

Simulated test statistics

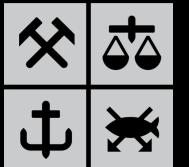

$T = -0.14$

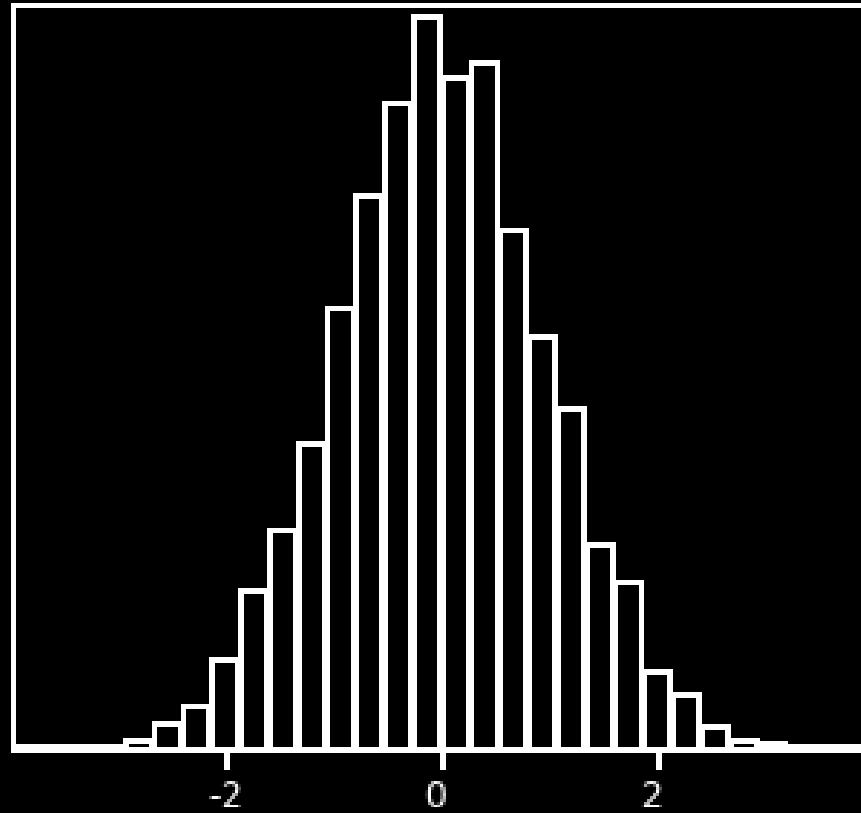

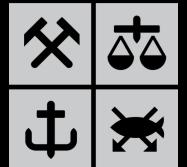

$$P - value \approx \frac{\# \text{ statistics} < -2.45}{5000} = 0.0076$$

$T = -2.45$

Null distribution of  $T$        $n=5000$

NHH  
TECH3

## STEP 6: ASSESS THE “STATISTICAL SIGNIFICANCE” OF THE RESULT

?                      **Significance level**

$$P - value = 0.0076 \leq \alpha$$

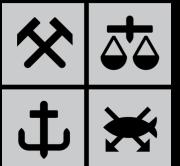

## STEP 6: ASSESS THE “STATISTICAL SIGNIFICANCE” OF THE RESULT

$$P - value = 0.0076 \leq 0.01$$

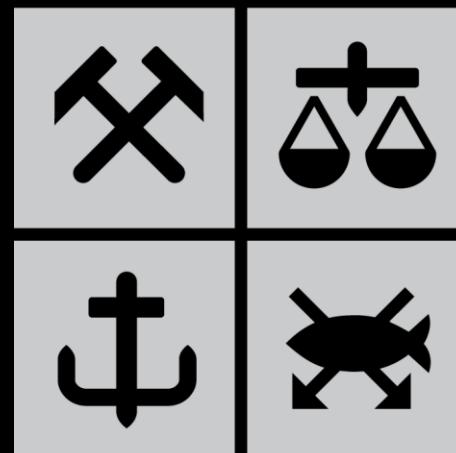

- *Reject  $H_0$*
- There is statistical significant evidence that the nudge reduce electricity consumption

# THE LOGIC OF NHST

1. Formulate a hypothesis that embodies our prediction (before seeing the data)
2. Specify null and alternative hypotheses
3. Collect some data relevant to the hypothesis
4. Compute a statistic that can quantify the amount of evidence against the null hypothesis
5. Compute the probability of the observed value (or something more “extreme”) of that statistic assuming that the null hypothesis is true
6. Assess the “statistical significance” of the result
